

FIFA World Cup 2026 - Model-Based Prediction

Generated 2026-06-16 | Engine: github.com/govindgoel2001/Sportsbetting (Dixon-Coles + Elo + 10-agent panel + tactics + player/flank lanes + formations/chemistry + 19-phase game-state sim + 20,000-run Monte Carlo + probability calibration)

Read this first

This is a **probabilistic forecast**, not a result - the engine simulates the whole tournament 20,000 times over the real WC2026 draw. Even the strongest side lifts the trophy only about 1 time in 4; treat every percentage as a distribution, not a prophecy.

Title odds - top 15 (20,000 simulations)

#	Team	Win	Final	Semi	QF	R16	Advance
1	Spain	23.5%	38.1%	57.7%	76.8%	96.5%	99%
2	Argentina	21.6%	35.9%	54.2%	73.8%	94.0%	98%
3	France	12.5%	23.1%	42.6%	64.2%	86.3%	95%
4	England	10.0%	19.1%	36.6%	60.5%	84.2%	99%
5	Brazil	7.3%	14.8%	30.9%	55.1%	84.3%	98%
6	Germany	4.3%	10.2%	20.3%	48.0%	73.7%	97%
7	Morocco	3.7%	8.6%	18.4%	39.9%	69.7%	96%
8	Portugal	3.4%	8.3%	19.3%	42.2%	72.7%	94%
9	Netherlands	2.7%	6.9%	15.5%	40.1%	68.2%	92%
10	Japan	2.5%	6.2%	14.8%	30.7%	63.3%	94%
11	Colombia	1.5%	4.3%	10.7%	32.7%	61.8%	91%
12	Belgium	0.8%	3.0%	7.5%	26.9%	60.4%	95%
13	Senegal	0.8%	2.5%	6.6%	13.7%	47.8%	84%
14	Ecuador	0.8%	2.4%	6.7%	15.2%	44.3%	88%
15	Norway	0.7%	2.2%	6.2%	13.3%	47.0%	85%

Big-four (ARG+FRA+BRA+ESP) combined title ~ 65%. Three hosts (USA+MEX+CAN) combined ~ 0.9%.

Group qualifiers - advancement probability (vector chart)

Bar = probability of reaching the knockout stage. Dark green = predicted group winner, medium green = predicted runner-up, grey = elimination favourites. Standalone file: [diagrams/group_qualifiers.svg](#)

Knockout bracket - most-likely tree (vector diagram)

Left to right: Round of 16 -> winners -> Quarter-finals -> Semi-finals -> Final. Green = advances, gold = champion. Standalone file: [diagrams/knockout_bracket.svg](#)

FINAL: Argentina def. England (~57-43). 3rd place: Spain def. France.

Method & honest scope

Operative model = Dixon-Coles Poisson (45%) blended with Elo strength (55%), then nudged by a 10-agent condition panel (form, momentum, H2H, tactician, tempo, host/crowd, travel, climate, news, hydration), a style-vector tactical engine, positional player/flank lane duels, and formation + squad-chemistry shape. Matches resolve through a 19-phase game-state event sim (park-the-bus, chasing, stoppage-time goals); the tournament is then resampled 20,000 times.

Probability calibration (new): the full nuanced stack was mildly over-confident in favourites, so the final 1X2 is shrunk 0.35 toward the plain Dixon-Coles+Elo core. The shrink is set by principle (variance reduction), NOT fitted to the live games - leave-one-out showed tuning it would overfit.

Live track record (as of 2026-06-16, 10 games): the model called the result in 7. Probabilistically it scores Brier 0.60 - 0.58 after calibration - versus 0.58 for its own plain DC+Elo core and 1.00 for naive favourite-picking. On n=10 those gaps are inside bootstrap noise, so trust the ordering (STRONG > CLEAR > LEAN > TOSS-UP) over the exact number.

Honest scope: lineups assume first-choice XIs in good health - one injury reshapes a tie. Cross-confederation calibration is the weak link. The real accuracy unlock is a multi-thousand-match historical backtest (past World Cups, qualifiers, club leagues), not more model layers.

For research and entertainment only. Probabilities are not certainties. Bet responsibly.
