

FIFA World Cup 2026 - Model-Based Prediction

Generated 2026-06-09 | Engine: github.com/govindgoel2001/sportsbetting (Dixon-Coles + Elo + 20,000-run Monte Carlo) | Swarm overlay: github.com/666ghj/MiroFish (method only) | Tournament starts 11 June 2026

Read this first

The World Cup has NOT been played yet. This is a **probabilistic forecast** - the engine simulated the tournament 20,000 times over the real WC2026 draw. A 24% favourite still loses about 3 times in 4.

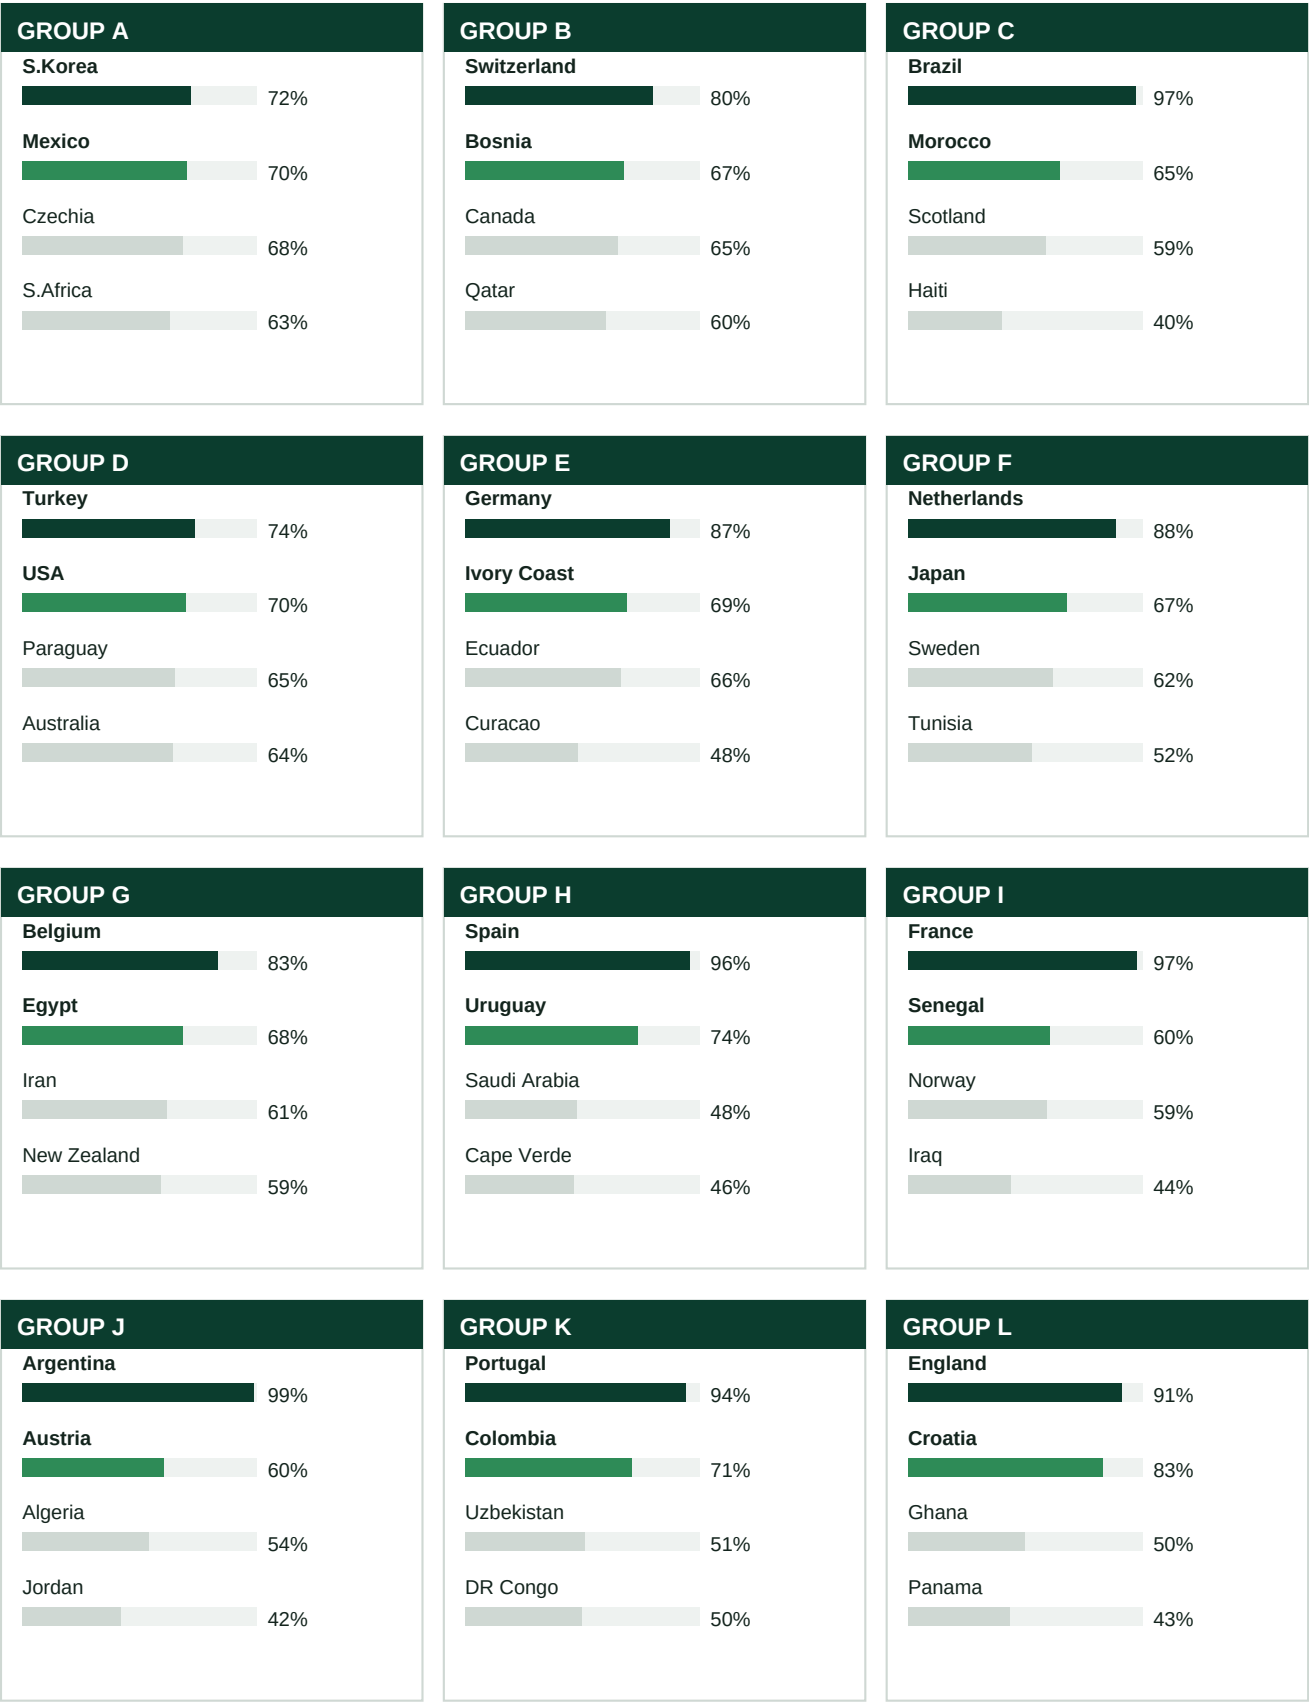

Title odds - top 15 (20,000 simulations)

#	Team	Win	Final	Semi	QF	R16	Advance
1	Argentina	23.8%	34.8%	49.8%	64.3%	76.4%	98.6%
2	France	17.8%	29.5%	44.0%	59.2%	78.3%	97.4%
3	Brazil	13.0%	21.5%	36.9%	53.5%	71.5%	97.1%
4	Spain	10.6%	19.2%	31.9%	43.9%	63.1%	95.6%
5	Portugal	7.1%	13.7%	24.4%	44.4%	64.2%	94.1%
6	England	5.4%	11.0%	21.9%	39.0%	60.4%	90.9%
7	Netherlands	3.9%	9.0%	17.6%	33.2%	50.8%	88.4%
8	Croatia	2.4%	6.2%	13.6%	26.3%	47.6%	82.9%
9	Germany	1.9%	5.0%	11.6%	22.6%	52.5%	87.0%
10	Uruguay	1.0%	3.0%	7.5%	15.4%	29.2%	73.5%
11	Belgium	1.0%	3.2%	8.2%	20.9%	45.8%	83.1%
12	Colombia	0.9%	2.6%	6.8%	15.6%	33.1%	70.9%
13	Switzerland	0.8%	2.6%	7.0%	20.2%	45.2%	80.0%
14	Japan	0.7%	2.2%	6.2%	14.8%	29.1%	67.4%
15	Turkey	0.6%	1.9%	5.4%	14.1%	36.5%	73.5%

Big-four (ARG+FRA+BRA+ESP) combined title ~ 65%. Three hosts combined ~ 1.2%.

Group qualifiers - advancement probability (vector chart)

Bar = probability of reaching the knockout stage. Dark green = predicted group winner, medium green = predicted runner-up, grey = elimination favourites. Standalone file: [diagrams/group_qualifiers.svg](#)

Knockout bracket - most-likely tree (vector diagram)

Left to right: Round of 16 -> winners -> Quarter-finals -> Semi-finals -> Final. Green = advances, gold = champion. Standalone file: diagrams/knockout_bracket.svg

FINAL: Argentina def. France (~52-48). 3rd place: Brazil def. Spain.

Method & honest scope

Operative model = Dixon-Coles Poisson (0.50) + Elo (0.30), renormalised to 0.625/0.375 (exactly src/sports/football.py). Elo->goals via supremacy=(EloA-EloB)/130 on a 2.6-goal WC baseline; scorelines from the repo's Dixon-Coles grid ($\rho=-0.13$); knockouts to penalties as a near coin-flip.

What did NOT run: XGBoost/Random-Forest fell back (no trained .pkl for nations); news sentiment, agent-debate, H2H, injuries and chemistry were inactive (need live feeds + API keys). The Elo ratings carry the signal.

MiroFish overlay is qualitative only - the real stack (paid Qwen + Zep keys, camel-oasis, long LLM-agent runs) was not deployed; a 6-persona analyst panel adjusted the baseline by judgment, not new computation.

Betting layer: true arbitrage (same outcome priced differently across Polymarket/Kalshi by more than fees) found NONE on the WC outright. Model 'edge' is NOT risk-free; for a sharp market assume most positive edges are model error. Sizing = quarter-Kelly. Jurisdiction (New Delhi): verify legality before funding.

For research and entertainment only. Probabilities are not certainties. Bet responsibly.
